- Notes
- 1

Enhanced Player Path Counts is the expected number of players that fit into the AA/A/B divisions based upon the playing history of each registered player. The probability of a player being placed in a tier is a function of the tiering of each player from their past two seasons, and is adjusted for team success for both seasons.
- 2

Player Path Success Correlation is a function of the percentages of AA/A/B players that are expected to populate the teams, which is based on the Enhanced Player Path Counts and the Selected Team Slate for each association. These correlations were developed using player path data for actual rosters from past seasons.
- 3

Expected GPG is the average goals per game that are expected for the players that are expected to be assigned to each tier. The expected tiering assignments are calculated from the players with the highest (AA+A) player path probabilities for the A teams. Goal scoring expectation for each player is calculated based upon their goal scoring rate from the past season, multiplied by a data-correlated factor for the anticipated change in tier. ex. A U19A player who is expected to play U19A for their second year will have a higher multiplier than a U19B player who is expected to play in U19A.
